

### Station 1 - Points

Definition	<u>Points</u> are locations in space with no dimension represented by a dot.	
How to label	<u>Points</u> are labeled using a single, capital letter. It is important to use a capital letter because lowercase letters are used for labeling <u>lines</u> .	P •
Diagram	P •	
HW Problems & Examples	<u>Points</u> are relatively easy and used in almost everything else we do. Almost every homework problem we do will use <u>points</u> in some way.	
Extra Information	You have already plotted points on a number and on a 2-dimensions coordinate graph. Eventually, we will start plotting points in 3-dimensions!	

### Station 4 - Planes

Definition	<u>Planes</u> are flat surfaces with no thickness, extending forever in all directions on that surface.	
How to label	<p><u>Planes</u> are labeled in one of two ways.</p> <p>The first is by writing the word <u>plane</u> and listing any 3 <u>points</u> in that <u>plane</u> that do NOT lie on the same <u>line</u>.</p> <p>The second way is by using an uppercase script letter, similar to a fancy font.</p>	<p>In the diagram below, you can label the plane either:</p> <p>Plane <i>ABC</i> or Plane <i>R</i></p>
Diagram		
HW Problems & Examples	1.1 #6,8,34,55(b and c)	
Extra Information	<p>A <u>plane</u> is a 2-dimensional sheet, but can be drawn in 3-dimensional space. This means it can be challenging to draw, as shown in the diagram above.</p> <p>There are multiple other ways to label the plane above. Here are a few examples:</p> <p style="text-align: center;">Plane <i>ACB</i> Plane <i>BAC</i> Plane <i>CAB</i></p>	

### Station 2 - Segments

Definition	A <u>segment</u> is section of a line consisting of two <u>points</u> (called <u>endpoints</u> ) and all the <u>points</u> between them on the <u>line</u> .	
How to label	<p><u>Segments</u> are labeled using the two endpoints and a bar drawn above them.</p> <p>Since neither <u>endpoint</u> is more important than the other, the order you list them does not matter. The two segments to the right are actually the same segment!</p>	$\overline{AB}$ $\overline{BA}$
Diagram		
HW Problems & Examples	1.1 #12	
Important Information	<u>Segments</u> are also called known as <u>Line Segments</u> since they are part of a line.	

### Station 5 - Rays

Definition	<u>Rays</u> are a part of a <u>line</u> that starts at one <u>point</u> (called the <u>endpoint</u> ) and extends forever in one direction.	
How to label	<p><u>Rays</u> are labeled using two <u>points</u>, the first being the <u>endpoint</u> and the second being any <u>point</u> on the <u>ray</u> in the direction it extends.</p> <p><u>Important!</u> The arrow on top of the two letters always points right, regardless of what direction the <u>ray</u> actually extends.</p>	$\overrightarrow{AB}$ $\overrightarrow{BA}$
Diagram	<p>In the diagram to the right:</p> <ul style="list-style-type: none"> <li>The top is: <math>\overrightarrow{AB}</math></li> <li>The middle is: <math>\overrightarrow{AB}</math></li> <li>The bottom is: <math>\overrightarrow{BA}</math></li> </ul>	
HW Problems & Examples	1.1 #14	
Extra Information	<p>If a <u>ray</u> contains more than 2 <u>points</u>, you can label it in multiple ways. The key is making sure the first letter is always the <u>endpoint</u>. For example, the <u>ray</u> to the right could be called <i>HA</i> or <i>HM</i>.</p>	

### Station 3 - Lines

Definition	<u>Lines</u> are straight paths with no thickness extending forever in <u>opposite</u> directions.	
How to label	<p><u>Lines</u> are labeled by choosing any <u>two</u> <u>points</u> on the line with a double-sided arrow on top.</p> <p>You may also label a <u>line</u> using a single, lowercase letter. In the diagram below, you can label it line <i>m</i>.</p>	<p>All the <u>seven</u> of the following are correct ways to label the line below:</p> <p><math>\overleftrightarrow{AB}</math> <math>\overleftrightarrow{AG}</math> <math>\overleftrightarrow{GB}</math> <math>\overleftrightarrow{BA}</math> <math>\overleftrightarrow{GA}</math> <math>\overleftrightarrow{BG}</math> Line <i>m</i></p>
Diagram		
HW Problems & Examples	1.1 #4,7	
Extra Information	<p><u>Lines</u> extend forever in opposite directions, and thus have no length.</p> <p>Only <u>two points</u> are needed to label a <u>line</u>. You <u>never</u> use three or more <u>points</u> to label a <u>line</u>. For example, an <u>incorrect</u> way to label the line above would be:</p> <p style="text-align: center;"><math>\overleftrightarrow{AGB}</math> NO</p>	

### Station 6 – Opposite Rays

Definition	<u>Opposite Rays</u> are two rays that (1) <u>start at the same endpoint</u> and (2) <u>extend in opposite directions</u> .	
How to label	<p><u>Opposite rays</u> are simply <u>rays</u>, so the way we label them is the same.</p>	<p>In the diagram below, since they share a common endpoint and extend in opposite directions, the only pair of <u>opposite rays</u> are:</p> <p style="text-align: center;"><math>\overleftrightarrow{ED}</math> <math>\overleftrightarrow{EF}</math></p>
Diagram		
HW Problems & Examples	1.1 #15,50	
Extra Information	<p>The keys to being <u>opposite rays</u>:</p> <ol style="list-style-type: none"> <li>They must start at the same endpoint, in this example point E</li> <li>They must extend in opposite directions, in this example one extends left and one extends right.</li> </ol> <p>When <u>opposite rays</u> are put together, they form a <u>line</u>!</p>
